DATA SHEET

Reagent: pNL-r-HSAS

Catalog Number: 4101

Lot Number: 040927

Release Category: E

Provided: 2.45 µg of dried purified DNA stabilized in DNAsable PLUS

Cloning Vector: pNL4-3

Description: pNL-r-HSAS is a HIV-1-based reporter virus that is both replication-competent and pathogenic *in vivo*. Virus produced from pNL-r-HSAS infects cells expressing both CD4 and CXCR4. Infected cells express surface HSA which is detectable by flow cytometry.

Special Characteristics: A 267 bp fragment from the ORF of HSA was inserted into an introduced XbaI site (nt 5625) and an existing EcoRI site (nt 5743) of pNL4-3. This site is within the NL4-3 vpr gene, which was partially deleted during the digests. In addition, the start of vpr and two potential start sites in the 5' end of vif are silenced by site-specific mutagenesis. The insert was cloned in the 5'-3' orientation. The murine HSA insert was derived from the plasmid pSL87c4-1. The insert contains the HSA ORF and 36 extraneous bases from the original plasmid. HSA expression is driven by the HIV-1 LTR.

This reagent is currently being provided as dried purified DNA stabilized in DNAsable PLUS. Please see the notice for additional information and the protocol for reconstitution of dried DNA reagents. [Dried DNA Notice](#)

Recommended Storage: Keep the reagent at room temperature in a dry storage cabinet or in a moisture barrier bag.

Contributor: Drs. Beth Jamieson and Jerome Zack.
